

HOW WE CALCULATE OUR WATER CONSUMPTION

Water consumption data is collected and reported monthly by the Safaricom facilities team in m³. Representatives from each region report site data to the facilities team at the Safaricom head office. The water consumption data for all sites is consolidated at head office.

In FY19, our total water consumption is 99 827 m³, and is made up of the following sources:

- Bottled water is the water consumed from the Safaricom water dispensers.
- Municipal water is calculated based on monthly invoices received from the municipality
- Water from bowzers is the water purchased from private companies when there are municipal water shortages.
- Borehole water is the water extracted from boreholes at Safaricom sites.
